

# Connecting photovoltaic panels of different powers in parallel

### Overview

As we said above, when connecting solar panels in series, we get an increased wattage in combination with a higher voltage. Such 'higher voltage' means that series connection is more often applied in grid-tied solar systems where: 1) the system voltage is often at least 24 volts, and 2) the solar. Here is a series connection of solar panels of different voltage ratings and the same current rating: You can see that if one of the solar panels has a lower voltage rating (and the same current rating) compared to the remaining panels, the output power is lower than in the. The next basic type of connecting solar panels is in parallel. Connecting solar panels in parallel is just the opposite of series connection and is used to increase the total output. A combination of series and parallel connection is also possible. Indeed, this depends on the maximum possible total output voltage and maximum possible total output current of the. Here is a parallel connection of solar panels of different voltage ratings and the same current rating: As you can see, things are getting worse, since the total voltage of the array.
